Phased Roadmap

4. Data Sources & Methodology

1. Executive Summary

This report presents a comprehensive SEO audit of **texttospeechh.com** for a **AI SaaS tool - free online text-to-speech / AI voice generator** site, generated on August 05, 2026. Findings combine technical, content, schema, performance, visual, and search-readiness evidence as available.

72/100

SEO HEALTH SCORE

Critical Issues Found:

1. **Info:** 11 URLs return 404, including 4 dead sitemap URLs and footer links (/cookie-policy, /dmca, /accessibility, /community-guidelines, /language/french, /language/german) that render on every page
2. **Info:** Sitemap lists 9 redirecting /blog/* URLs and 4 dead URLs, and completely omits the real blog posts under /text-to-speech/blog/*
3. **Info:** Hreflang tags on every page point to 9 locale URLs (/uk, /ca, /au, /hi, /de, /fr, /es, /ja, /pt) that all return 404
4. **Info:** Canonical host inconsistency: inner pages canonicalize to non-www (https://texttospeechh.com/...) which 308-redirects to www, while the homepage canonical uses www
5. **Info:** Lab performance: FCP/LCP ~2.7s (likely 'Poor' on mobile) driven by render-blocking GA4 + Clarity third-party scripts

Quick Wins:

1. Point canonical tags on all inner pages to the www hostname (https://www.texttospeechh.com/...) to match the 308 redirect target
2. Create the 6 missing footer/legal pages or 301-redirect them to nearest equivalents
3. Fix or regenerate sitemap.xml: remove 4 dead URLs, replace /blog/* with /text-to-speech/*, add the 5 real blog posts
4. Remove broken hreflang locale targets until /uk, /fr, /de etc. are actually built; add self-referencing hreflang
5. Defer the GA4 and Clarity scripts (async already present) and add preload/preconnect hints to cut FCP

2. Audit Categories

2.1 Technical SEO

Score: **68/100**

What Works

- HTTPS enforced with 308 non-www->www redirect and Strict-Transport-Security
- Clean robots.txt with allow/disallow rules and sitemap reference
- All 36 live pages emit a self-canonical
- 404 pages correctly return HTTP 404 with noindex, follow
- Vercel CDN caching and Brotli compression (Content-Encoding: br)

Findings

11 broken URLs (9 unique targets) return HTTP 404 **Critical**

Footer links on every page point to /cookie-policy, /dmca, /language/french and /language/german which all return 404. The homepage additionally links to /accessibility, /community-guidelines, /blog/ultimate-ai-texttospeechh.com-guide and /blog/text-to-speech-audiobook-creation (404). Blog post /text-to-speech/blog/text-to-speech-for-students links to dead /text-to-speech/txt-to-speech.

Recommendation: Create the missing legal/locale/community pages, or 301-redirect each dead URL to the nearest live equivalent (e.g. /cookie-policy -> /privacy-policy). Remove the four dead /blog/* footer links.

Sitemap contains 4 dead URLs, 9 redirecting URLs, and omits real blog posts **Critical**

sitemap.xml lists /blog/text-reader, /blog/ultimate-ai-texttospeechh.com-guide, /blog/ai-voiceover-for-youtube-shorts and /blog/text-to-speech-audiobook-creation (all 404). Nine /blog/* URLs 308-redirect to /text-to-speech/*. The five live blog posts (/text-to-speech/blog/best-ai-voices, elevenlabs-alternatives, how-text-to-speech-works, text-to-speech-for-students, text-to-speech-for-youtube) are not in the sitemap at all.

Recommendation: Regenerate sitemap.xml from live URLs: drop dead URLs, list only final /text-to-speech/* URLs, add all blog posts, keep the blog hub and tool pages. Re-submit in Search Console.

Canonical host inconsistent with redirect target **High**

All inner pages canonicalize to https://texttospeechh.com/... (non-www), but that hostname 308-redirects to https://www.texttospeechh.com. The homepage canonical correctly uses www. Google must follow the redirect to reconcile the canonical.

Recommendation: Update canonical tags on every inner page to <https://www.texttospeechh.com/<path>> and update the Organization/WebSite/SoftwareApplication schema 'url' fields likewise.

Security headers incomplete (no CSP, X-Frame-Options, X-Content-Type-Options, Referrer-Policy)

Medium

Only Strict-Transport-Security is returned. No Content-Security-Policy, X-Frame-Options, X-Content-Type-Options, Referrer-Policy or Permissions-Policy. Not a direct ranking blocker but weakens trust and click-through signals in some contexts.

Recommendation: Add X-Frame-Options: DENY, X-Content-Type-Options: nosniff, Referrer-Policy: strict-origin-when-cross-origin and a CSP in vercel.json headers.

Robots.txt Sitemap line references non-www hostname **Low**

robots.txt declares 'Sitemap: <https://texttospeechh.com/sitemap.xml>' (non-www), which 308-redirects to www.

Recommendation: Update to <https://www.texttospeechh.com/sitemap.xml>.

2.2 Content Quality

Score: **70/100**

What Works

- Primary page scored 96/100 on QRG-aligned content quality (density 1.0, 5,941 tokens)
- FAQ content is visible on-page (matches FAQPage schema)
- 1871-word in-depth guide on the primary page with structured headings and a comparison matrix
- Unique meta descriptions on every page

Findings

12+ thin pages under 300 words **High**

Language pages (222-234 words: /language/english, hindi, spanish, urdu), tool landing pages (231-284 words: /text-to-speech/voice-generator, word-to-speech, read-aloud, pdf-to-speech, online-text-to-speech, text-to-voice, free-text-to-speech), and /contact (284) carry minimal unique content and are likely doorway-style.

Recommendation: Expand each tool/language page to 800+ words with unique use-case guidance, FAQ, and examples, or merge and redirect thin variants to the closest canonical page.

Doorway-pattern /keyword/* URLs redirect to tool pages Medium

/keyword/free-ai-texttospeechh.com and /keyword/text-to-speech-free 308-redirect to /text-to-speech and /text-to-speech/free-text-to-speech. Keyword-stuffed paths are a Google doorway-page pattern and waste crawl budget.

Recommendation: 301-remove the /keyword/* URLs (or make them noindex) and ensure all internal links point directly to the canonical /text-to-speech/* paths.

Readability is very low (Flesch-Kincaid grade 15.2, FRE 16.0) Medium

The primary guide reads at post-graduate level with dense jargon (Tacotron 2, HiFi-GAN, WaveNet). Average sentence ~17 words, 84.6% of content is multi-syllable. This limits ranking for mass-market 'text to speech' queries.

Recommendation: Add a plain-language summary and shorten complex sentences; introduce sub-headers with scannable bullets and a TL;DR box aimed at a grade 8-9 reading level.

Weak E-E-A-T: no named author, no author bios, domain 9 days old Medium

Article schema author is the Organization 'TextToSpeechH AI' with no person byline, no author page, and no publish date rendered in HTML (JSON-LD only). Domain registered 2026-07-27 (Hostinger). sameAs points only to an Instagram profile.

Recommendation: Add named human authors with bios and credentials for each blog post, show visible publish/modified dates, expand the About page, and grow legit off-site mentions.

2.3 On-Page SEO

Score: 78/100

What Works

- Every page has a unique title tag, meta description, canonical, and a single H1
- Clean heading hierarchy (one H1, logical H2/H3 structure)
- lang="en" set, Open Graph and Twitter Card meta present
- Internal linking to tool pages, language pages, and blog from the primary page

Findings

Title tags too long on ~30 pages (66-88 chars) High

Most titles exceed 60 chars and will truncate in SERPs, e.g. how-text-to-speech-works (88), elevenlabs-alternatives (82), text-to-speech-for-students (82). Brand suffix '| TextToSpeechH AI' pushes keywords past the limit.

Recommendation: Trim titles to 50-60 chars keeping the primary keyword first and shortening the brand suffix.

Some meta descriptions over 160 chars **Medium**

/privacy-policy (233), /terms (180), /about (198), /text-to-speech (161), and 3 others exceed the display limit and will be truncated in SERPs.

Recommendation: Rewrite descriptions to 140-158 chars with a clear call-to-action.

Hreflang locale targets are all 404 and not reciprocal **Critical**

Every page declares hreflang alternates to https://texttospeechh.com/uk, /ca, /au, /hi, /de, /fr, /es, /ja, /pt - all return 404. The existing /language/* pages (english, hindi, spanish, urdu) are not referenced. No self-referencing hreflang and no x-default localization.

Recommendation: Until localized sites are live, remove the hreflang block entirely. When built, point hreflang at the actual locale URLs (e.g. /language/french), add reciprocal tags on each locale page, and include a self-referencing entry plus x-default.

No visible publication date or author on blog posts **Low**

Article dates exist only in JSON-LD; no <time> or visible byline, reducing freshness signals in SERPs.

Recommendation: Render a visible publish date and author byline on every article.

2.4 Schema / Structured Data

Score: 92/100

What Works

- All 36 live pages include valid JSON-LD
- Primary page has 6 valid blocks: Organization, WebSite, SoftwareApplication, FAQPage, BreadcrumbList, Article
- BreadcrumbList and FAQPage schema match on-page content
- SoftwareApplication marks the free tool with price 0.00

Findings

Article author is Organization only; no person-level authority **Medium**

Article.author and publisher both resolve to 'TextToSpeechH AI'. Google prefers named Person authors for article rich results and E-E-A-T.

Recommendation: Add author Person schema with name, jobTitle, url and sameAs for each post; keep Organization as publisher.

SoftwareApplication lacks aggregateRating and review data **Low**

The app schema has name/url/operatingSystem/applicationCategory/offers but no aggregateRating, review, or screenshot/image properties that would qualify for richer presentation.

Recommendation: Add aggregateRating/review only once real user reviews exist, plus a screenshot image.

Organization schema has a single sameAs and no address/contact page **Low**

sameAs lists only the Instagram profile; no telephone, address, or founder info. Weakens local/entity disambiguation.

Recommendation: Add additional legit sameAs profiles and a physical/registered address when available.

2.5 Performance (Core Web Vitals)

Score: **65/100**

What Works

- CLS 0.0 (no layout shift detected)
- Very small page: ~213KB transfer, 11 main-document resources, single stylesheet + single script
- Brotli compression and CDN caching via Vercel
- TTFB ~703ms from our lab environment

Findings

FCP and LCP ~2.7s - likely 'Poor' on mobile **High**

Lab run (desktop viewport) shows first paint/FCP ~2688ms and LCP ~2688ms, above the 2.5s 'good' threshold. The 169KB Google Analytics gtag script and Microsoft Clarity load early and compete with the hero render.

Recommendation: Defer analytics with requestIdleCallback or load after load event; preload the LCP element; move Clarity behind idle time. Verify with PageSpeed Insights once an API key is configured.

Render-blocking Google Fonts request **Medium**

Inter font via Google Fonts is fetched render-blocking (47KB woff2). No font-display: swap or preload of the LCP font.

Recommendation: Add font-display=swap (already present), preload the woff2, or self-host the font subset.

No lazy loading or resource hints for core assets **Low**

0 lazy-loading images and no preload/dns-prefetch for app.js/style.css. Minor given the tiny payload, but preload of above-fold assets would cut FCP.

Recommendation: Preload app.js and style.css, and lazy-load any below-fold images once content imagery is added.

2.6 AI Search Readiness

Score: **55/100**

What Works

- robots.txt allows all AI crawlers by default (no GPTBot/ClaudeBot blocks)
- Long-form content with clear H2 structure is naturally citable
- FAQPage and Article schema improve machine comprehension
- Clean, semantic HTML headings help LLM extraction

Findings

No llms.txt or llms-full.txt file **High**

<https://www.texttospeechh.com/llms.txt> and [/llms-full.txt](https://www.texttospeechh.com/llms-full.txt) both return 404. LLMs have no curated index of the site's key pages for citations.

Recommendation: Publish an llms.txt with the tool homepage, key tool pages, and top blog articles with one-line summaries, plus an llms-full.txt with condensed page content.

No external citations, sources, or named authors to build citability trust **Medium**

Articles cite no sources, studies, or external links; content reads as AI-generated. Domain is 9 days old with no backlink/authority footprint, so LLM answer engines have little reason to cite it.

Recommendation: Add real sources/footnotes, named expert authors, and earn off-site mentions (Reddit, ProductHunt, tutorials) that LLM crawlers can pick up.

2.7 Images

Score: **82/100**

What Works

- Both existing tags have descriptive alt text
- og-image.png (38KB) and logo.svg are lightweight
- SVG logo used for scalable branding

Findings

No content or illustrative images anywhere on the site **Medium**

The 36 live pages contain only 2 logo images total. No screenshots, hero imagery, or diagrams - the content is text-only, reducing engagement, image-SERP potential, and LCP candidates.

Recommendation: Add descriptive hero/screenshot images to the tool pages and blog posts with keyword-rich alt text; consider WebP/AVIF formats.

3. Action Plan

Phase 1: Critical Fixes Week 1

- Fix or 301-redirect all 9 broken internal links (footer /cookie-policy, /dmca, /language/french, /language/german, homepage /accessibility, /community-guidelines, 2 dead blog links, /text-to-speech/txt-to-speech)
- Regenerate sitemap.xml: remove 4 dead URLs, replace /blog/* redirects with /text-to-speech/* canonicals, add all 5 blog posts and blog hub
- Remove broken hreflang locale tags or point them to real URLs; add self-referencing hreflang
- Fix canonical tags on all inner pages to <https://www.texttospeechh.com/<path>>
- Remove /keyword/* doorway URLs (301 to canonical tool pages)

Phase 2: High-Impact Improvements Weeks 2-3

- Trim title tags to 50-60 chars across ~30 pages
- Rewrite meta descriptions over 160 chars (privacy-policy, terms, about, etc.)
- Defer GA4 + Clarity and add preload hints to improve FCP/LCP below 2.5s
- Expand the 12 thin tool/language pages to 800+ words of unique content
- Add security headers via vercel.json (X-Frame-Options, nosniff, Referrer-Policy, CSP)

Phase 3: Content & Authority Month 2

- Add named human authors with bios and visible publish dates on all articles
- Add external citations/sources to build AI citability and E-E-A-T
- Publish llms.txt and llms-full.txt
- Add content imagery (screenshots, hero images) with alt text
- Expand About page and add legitimate off-site profiles to Organization sameAs

Phase 4: Monitoring & Iteration Ongoing

- Connect Google Search Console + PageSpeed Insights API key and re-verify Core Web Vitals with field data
- Track indexation of new pages and monitor crawl stats after sitemap changes
- Watch for manual actions on /keyword/* doorway patterns after removal
- Re-run this audit in 4-6 weeks to measure improvement

Data Sources & Methodology

Source	Description	Update Frequency
PageSpeed Insights API	Lighthouse lab audit (mobile emulation, Moto G Power, slow 4G)	Real-time
Chrome UX Report (CrUX)	28-day rolling field data from real Chrome users	Daily ~04:00 UTC
CrUX History API	25-week p75 trend data per metric	Weekly
Google Search Console	Search Analytics (clicks, impressions, CTR, position)	2-3 day lag
URL Inspection API	Per-URL index status, coverage state, crawl info	Real-time (2,000/day)

Report generated by Claude SEO — Google SEO Intelligence Skill — August 05, 2026
Methodology based on Google Web Vitals thresholds, Search Console documentation, and Lighthouse scoring algorithms.
